通讯作者: 刘浩

properties of the generalized Roper–Suffridge operators on Bergman–Hartogs domains are mainly discussed. With the characteristics of Bergman–Hartogs domains and the geometric properties of subclasses of biholomorphic mappings, the generalized Roper–Suffridge operators are proved to preserve the properties of strong and almost spirallike mappings of type β and order α , almost starlike mapping of complex order λ , $S_{\Omega}^*(\beta, A, B)$ on Bergman–Hartogs domains under different conditions. Sequentially, the same conclusions are obtained for the reduced Roper–Suffridge extension operators.

Keywords Roper–Suffridge operator; spirallike mappings; Bergman–Hartogs domains

1 引言

单复变几何函数论中有许多优美的结论, 在将这些结论推广到多复变数空间的过程中, 人们发现一些基本的结论在多复变中不再成立 (例如在单位圆盘上双全纯函数的齐次展开式的系数的模是有界的^[3]). 后来人们对映照加上几何限制, 例如星形性和凸性. 星形映照和凸映照^[9] 在多复变几何函数论中起着很重要的作用, 也是讨论得最多的映照. 目前对于星形映照和凸映照已经有很多完美的结果, 近年来许多学者将讨论的对象转移到星形映照和凸映照的子族或扩充^[22].

螺形映照^[12] 是星形映照的扩充, β 型螺形映照是螺形映照的一个子族, 其几何性质是单位球在 $\frac{e^{-i\beta}}{\|z\|^2}\bar{z}'[Df(z)]^{-1}f(z)$ 下的像落在右半平面. 根据映照的不同几何特征人们定义了以下螺形映照的子族: 强 α 次殆 β 型螺形映照和 $S_{\Omega}^*(\beta, A, B)$ 是螺形映照的子族, 其几何性质是单位球在映照 $\frac{e^{-i\beta}}{\|z\|^2}\bar{z}'[Df(z)]^{-1}f(z)$ 下的像落在右半平面内的某个圆盘. 强 α 次殆星形映照^[2] 和强 β 型螺形映照^[13] 均为强 α 次殆 β 型螺形映照的子族. 复数 λ 阶殆星形映照是星形映照的扩充, 其几何性质是单位球在 $(1-\lambda)\|z\|^2\bar{z}'[Df(z)]^{-1}f(z)$ 下的像落在右半平面且其实部大于或等于某个常数. α 阶殆星形映照是复数 λ 阶殆星形映照的一个子族. 另外, 螺形映照还有许多其它子族, 例如 α 次殆 β 型螺形映照. 在单复变中易找到上述映照的具体例子, 然而在多复变中却很困难.

1995 年, Roper 和 Suffridge^[21] 引入了以下算子:

$$\phi_n(f)(z) = (f(z_1), \sqrt{f'(z_1)}z_0)',$$

其中

$$z = (z_1, z_0) \in B^n, \quad z_1 \in D, \quad z_0 = (z_2, \dots, z_n) \in \mathbb{C}^{n-1}, \quad f(z_1) \in H(D), \quad \sqrt{f'(0)} = 1.$$

后来该算子被称为 Roper–Suffridge 算子, 应用它我们可以由 \mathbb{C} 中单位圆盘 D 上正规化的局部双全纯函数构造 \mathbb{C}^n 中单位球上正规化的局部双全纯映照, 并保持星形性、凸性和 block 性质. Roper–Suffridge 算子的引入为构造高维复空间中具有特殊几何性质的双全纯映照提供了强有力的工具, 因此许多学者开始研究该算子.

Graham 等^[10,11] 讨论了推广的 Roper–Suffridge 算子保持星形性和 block 性质. 2002 年, Graham 等^[8] 在单位球 B^n 上将 Roper–Suffridge 算子推广为

$$\phi_{n,\beta,\gamma}(f)(z) = \left(f(z_1), \left(\frac{f(z_1)}{z_1} \right)^{\beta} (f'(z_1))^{\gamma} z_0 \right)',$$

其中

$$\beta \in [0, 1], \quad \gamma \in \left[0, \frac{1}{2}\right], \quad \beta + \gamma \leq 1,$$

且 f, z, z_1, z_0 同上. 他们证明了推广的 Roper–Suffridge 算子在 B^n 上保持星形性, 当且仅当 $(\beta, \gamma) = (0, \frac{1}{2})$ 时保持凸性.

2003 年, Gong 和 Liu [7] 将 Roper–Suffridge 算子推广为

$$\phi_{n, \frac{1}{p_2}, \dots, \frac{1}{p_n}}(f)(z) = (f(z_1), (f'(z_1))^{\frac{1}{p_2}} z_2, \dots, (f'(z_1))^{\frac{1}{p_n}} z_n)',$$

其中 $p_j \geq 1, j = 2, \dots, n$ 且 f, z, z_1 同上. 他们证明了推广后的算子在 Reinhardt 域

$$\Omega_{n, p_2, \dots, p_n} = \left\{ z \in \mathbb{C}^n : |z_1|^2 + \sum_{j=2}^n |z_j|^{p_j} < 1 \right\}, \quad p_j \geq 1, \quad j = 1, \dots, n$$

上保持 ε 星形性, 于是, 当 $\varepsilon = 0$ 及 $\varepsilon = 1$ 时, 该算子在 $\Omega_{n, p_2, \dots, p_n}$ 上分别保持星形性和凸性.

近年来, 关于 Roper–Suffridge 算子又有了许多新的结论 [16, 24, 28]. 2005 年 Muir [20] 引入了推广的 Roper–Suffridge 算子

$$F(z) = (f(z_1) + f'(z_1)P(z_0), \sqrt{f'(z_1)}z_0)',$$

其中 f 是单位圆盘 D 上正规化的双全纯函数, $z = (z_1, z_0)' \in B^n$, $z_1 \in D$, $z_0 = (z_2, \dots, z_n)' \in \mathbb{C}^{n-1}$. 幂函数取分支使得 $\sqrt{f'(0)} = 1$. $P : \mathbb{C}^{n-1} \rightarrow \mathbb{C}$ 是 2 阶齐次多项式. Muir 和 Suffridge 证明了推广后的算子在 $\|P\| \leq \frac{1}{4}$ 和 $\|P\| \leq \frac{1}{2}$ 时分别保持星形性和凸性. Kohr 和 Muir [14, 19] 应用 Loewner 链讨论了推广后的算子. 王建飞和刘太顺 [25] 将 Roper–Suffridge 算子推广为

$$F(z) = (f(z_1) + f'(z_1)P(z_0), [f'(z_1)]^{\frac{1}{m}} z_0)',$$

并讨论了推广后的算子在 B^n 上保持 α 次殆星形性和 α 次星形性, 其中 $[f'(0)]^{\frac{1}{m}} = 1$ 且 $P : \mathbb{C}^{n-1} \rightarrow \mathbb{C}$ 是 m ($m \in \mathbb{N}, m \geq 2$) 次齐次多项式.

2016 年唐言言 [23] 在 Bergman–Hartogs 域上推广了 Roper–Suffridge 算子, 并讨论了推广后的算子保持一些双全纯映照的几何性质. 唐言言引入了算子

$$F(w, z) = (w_{(1)}(f'(z_1))^{\delta_1}, \dots, w_{(s)}(f'(z_1))^{\delta_s}, f(z_1) + f'(z_1)P(z_0), (f'(z_1))^{\frac{1}{k}} z_0)', \quad (1.1)$$

其中 $f(z_1)$ 是 D 上正规化的双全纯函数且 $P(z_0)$ 是 \mathbb{C}^{n-1} 上关于 z_0 的 k ($k \geq 2$) 次齐次多项式, 并证明了算子 (1.1) 在 Bergman–Hartogs 域

$$\Omega_{p_1, \dots, p_s, q}^{B^n} = \{(w_{(1)}, \dots, w_{(s)}, z) \in \mathbb{C}^{m_1} \times \dots \times \mathbb{C}^{m_s} \times B^n : \|w_{(1)}\|^{2p_1} + \dots + \|w_{(s)}\|^{2p_s} < K_{B^n}(z, z)^{-q}\}$$

上在不同的条件下保持 α 次殆 β 型螺形性、 α 次 β 型螺形性及强 β 型螺形性.

现在将 Roper–Suffridge 算子推广为

$$\begin{aligned} F(w, z) = & \left(w_{(1)} \left(\frac{f(z_1)}{z_1} \right)^{\delta_1}, \dots, w_{(s)} \left(\frac{f(z_1)}{z_1} \right)^{\delta_s}, \right. \\ & \left. f(z_1) + \frac{f(z_1)}{z_1} \sum_{j=2}^n P_j(z_j), \left(\frac{f(z_1)}{z_1} \right)^{\frac{1}{\gamma_2}} z_2, \dots, \left(\frac{f(z_1)}{z_1} \right)^{\frac{1}{\gamma_n}} z_n \right)', \end{aligned} \quad (1.2)$$

令 $w_{(1)} = \dots = w_{(s)} = 0$, 则有算子

$$F(z) = \left(f(z_1) + \frac{f(z_1)}{z_1} \sum_{j=2}^n P_j(z_j), \left(\frac{f(z_1)}{z_1} \right)^{\frac{1}{\gamma_2}} z_2, \dots, \left(\frac{f(z_1)}{z_1} \right)^{\frac{1}{\gamma_n}} z_n \right)'. \quad (1.3)$$

显然算子 (1.3) 是

$$F(z) = \left(f(z_1), \left(\frac{f(z_1)}{z_1} \right)^{\frac{1}{\gamma_2}} z_2, \dots, \left(\frac{f(z_1)}{z_1} \right)^{\frac{1}{\gamma_n}} z_n \right)'$$

的一个推广 (见文 [4, 17, 26]).

本文主要讨论在不同的条件下算子 (1.2) 在域 $\Omega_{p_1, \dots, p_s, q}^{B^n}$ 上保持一些双全纯映照子族的性质. 第 2 节, 给出一些定义和引理. 第 3 至 5 节, 讨论算子 (1.2) 在 $\Omega_{p_1, \dots, p_s, q}^{B^n}$ 上在不同的条件下分别保持强 α 次殆 β 型螺形映照、复数 λ 阶殆星形映照和 $S_\Omega^*(\beta, A, B)$ 的几何不变性. 由此得到算子 (1.3) 在 B^n 上保持同样的性质, 以及算子 (1.2) 在 $\Omega_{p_1, \dots, p_s, q}^{B^n}$ 上保持强 α 次殆星形性、 α 次 β 型螺形性和强 α 次 β 型螺形性等. 所得结论推广了已有的结果.

2 定义及引理

以下 D 表示 \mathbb{C} 中的单位圆盘, B^n 表示 \mathbb{C}^n 中单位球. $DF(z)$ 表示 F 在 z 点 Fréchet 导数.

定义 2.1 ^[1] 设 Ω 是 \mathbb{C}^n 中的有界星形圆型域, 其 Minkowski 泛函 $\rho(z)$ 在除去一个低微流形外是 C^1 的. 设 $f(z)$ 是 Ω 上正规化的局部双全纯映照, $\alpha \in [0, 1)$, $\beta \in (-\frac{\pi}{2}, \frac{\pi}{2})$, 且

$$\left| \frac{-\alpha + i \tan \beta}{1 - \alpha} + \frac{1 - i \tan \beta}{1 - \alpha} \frac{2}{\rho(z)} \frac{\partial \rho}{\partial z}(z) (Df(z))^{-1} f(z) - \frac{1 + c^2}{1 - c^2} \right| < \frac{2c}{1 - c^2},$$

则称 $f(z)$ 是 Ω 上的强 α 次殆 β 型螺形映照.

在定义 2.1 中分别令 $\alpha = 0$, $\beta = 0$ 及 $\alpha = \beta = 0$, 则得到强 β 型螺形映照、强 α 次殆星形映照和强星形映照的定义.

定义 2.2 ^[27] 设 Ω 是 \mathbb{C}^n 中的有界星形圆型域, 其 Minkowski 泛函 $\rho(z)$ 在除去一个低微流形外是 C^1 的. 设 $F(z)$ 是 Ω 上正规化的局部双全纯映照且

$$\Re \left[(1 - \lambda) \frac{2}{\rho(z)} \frac{\partial \rho}{\partial z}(z) J_F^{-1}(z) F(z) \right] \geq -\Re \lambda, \quad z \in \Omega \setminus \{0\},$$

其中 $\lambda \in \mathbb{C}$, $\Re \lambda \leq 0$, 则称 $F(z)$ 是 Ω 上的复数 λ 阶殆星形映照.

在定义 2.2 中令 $\lambda = \frac{\alpha}{\alpha-1}$, $\alpha \in [0, 1)$, 则得到 Ω 上 α 次殆星形映照的定义.

定义 2.3 ^[6] 设 Ω 是 \mathbb{C}^n 中的有界星形圆型域, 其 Minkowski 泛函 $\rho(z)$ 在除去一个低微流形外是 C^1 的. 设 $F(z)$ 是 Ω 上正规化的局部双全纯映照, 且

$$\left| i \tan \beta + (1 - i \tan \beta) \frac{2}{\rho(z)} \frac{\partial \rho}{\partial z}(z) J_F^{-1}(z) F(z) - \frac{1 - AB}{1 - B^2} \right| < \frac{B - A}{1 - B^2}, \quad z \in \Omega \setminus \{0\},$$

其中 $-1 \leq A < B < 1$, $\beta \in (-\frac{\pi}{2}, \frac{\pi}{2})$, 则称 $F \in S_\Omega^*(\beta, A, B)$.

在定义 2.3 中分别令 $A = -1 = -B - 2\alpha$, $A = -B = -\alpha$, $B \rightarrow 1^-$, 则得到 Ω 上相应的 α 次 β 型螺形映照 ^[18]、强 α 次 β 型螺形映照 ^[5] 和 α 次殆 β 型螺形映照 ^[29] 的定义.

引理 2.4 ^[23] 设 $\rho(w, z)$ 是 $\Omega_{p_1, \dots, p_s, q}^{B^n}$ 的 Minkowski 泛函, 且 $(w, z) \in \partial \Omega_{p_1, \dots, p_s, q}^{B^n}$, 则 $\rho(w, z) = 1$ 且

$$\frac{\partial \rho(w, z)}{\partial w_{ij}} = \frac{p_i \|w_{(i)}\|^{2p_i-2} \bar{w}_{ij}}{2\nabla_1 + 2\nabla_2}, \quad \frac{\partial \rho(w, z)}{\partial z_i} = \frac{\nabla_1 \frac{\bar{z}_i}{\|z\|^2}}{2\nabla_1 + 2\nabla_2}, \quad i = 1, \dots, s, \quad j = 1, \dots, m_i,$$

其中 $\nabla_1 = (n+1)q\pi^{nq}(n!)^{-q}(1 - \|z\|^2)^{(n+1)q-1}\|z\|^2$, $\nabla_2 = \sum_{k=1}^s p_k \|w_{(k)}\|^{2p_k}$.

引理 2.5 设 $F(w, z)$ 是由式 (1.2) 所定义的映照且 $\rho(w, z) = 1$, 则

$$\frac{2\partial\rho}{\partial(w, z)}(w, z)(DF(w, z))^{-1}F(w, z) = \frac{G(w, z)}{\nabla_1 + \nabla_2},$$

其中

$$\begin{aligned} G(w, z) = & \sum_{k=1}^s p_k \|w_{(k)}\|^{2p_k} \left[1 - \delta_k \frac{z_1 f' - f}{z_1 f'} \left(1 + \frac{1}{z_1} \sum_{l=2}^n (1 - \gamma_l) P_l(z_l) \right) \right] \\ & + \frac{|z_1|^2 \nabla_1}{\|z\|^2} \frac{f}{z_1 f'} \left[1 + \frac{1}{z_1} \sum_{l=2}^n (1 - \gamma_l) P_l(z_l) \right] \\ & + \sum_{j=2}^n \frac{|z_j|^2 \nabla_1}{\|z\|^2} \left[1 - \frac{1}{\gamma_j} \frac{z_1 f' - f}{z_1 f'} \left(1 + \frac{1}{z_1} \sum_{l=2}^n (1 - \gamma_l) P_l(z_l) \right) \right]. \end{aligned}$$

证明 由式 (1.2) 得

$$DF(w, z) = \begin{pmatrix} \left(\frac{f}{z_1}\right)^{\delta_1} & 0 & \cdots & 0 & v_1 & 0 & 0 & \cdots & 0 \\ \vdots & \vdots & \ddots & \vdots & \vdots & \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \cdots & \left(\frac{f}{z_1}\right)^{\delta_s} & v_s & 0 & 0 & \cdots & 0 \\ 0 & 0 & \cdots & 0 & u_1 & \frac{f}{z_1} p'_2(z_2) & \frac{f}{z_1} p'_3(z_3) & \cdots & \frac{f}{z_1} p'_n(z_n) \\ 0 & 0 & \cdots & 0 & u_2 & \left(\frac{f}{z_1}\right)^{\frac{1}{\gamma_2}} & 0 & \cdots & 0 \\ \vdots & \vdots & \ddots & \vdots & \vdots & \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \cdots & 0 & u_n & 0 & 0 & \cdots & \left(\frac{f}{z_1}\right)^{\frac{1}{\gamma_n}} \end{pmatrix},$$

其中

$$\begin{aligned} v_i &= w_{(i)} \delta_i \left(\frac{f(z_1)}{z_1}\right)^{\delta_i} \frac{z_1 f' - f}{z_1 f}, \quad i = 1, \dots, s, \\ u_1 &= f' + \frac{z_1 f' - f}{z_1^2} \sum_{j=2}^n p_j(z_j), \quad u_j = \frac{1}{\gamma_j} \left(\frac{f(z_1)}{z_1}\right)^{\frac{1}{\gamma_j}} \frac{z_1 f' - f}{z_1 f} z_j, \quad j = 2, \dots, n. \end{aligned}$$

令 $(DF(w, z))^{-1}F(w, z) = H(w, z) = (h_1, \dots, h_{s+n})'$, 有

$$DF(w, z)(h_1, \dots, h_{s+n})' = F(w, z),$$

则

$$\begin{cases} \left(\frac{f}{z_1}\right)^{\delta_i} h_i + v_i h_{s+1} = w_{(i)} \left(\frac{f(z_1)}{z_1}\right)^{\delta_i}, \quad i = 1, \dots, s, \\ u_1 h_{s+1} + \frac{f(z_1)}{z_1} \sum_{j=2}^n P'_j(z_j) h_{s+j} = f(z_1) + \frac{f(z_1)}{z_1} \sum_{j=2}^n P_j(z_j), \\ u_j h_{s+1} + \left(\frac{f}{z_1}\right)^{\frac{1}{\gamma_j}} h_{s+j} = \left(\frac{f(z_1)}{z_1}\right)^{\frac{1}{\gamma_j}} z_j, \quad j = 2, \dots, n. \end{cases}$$

经直接计算得

$$\begin{cases} h_i = w_{(i)} \left[1 - \delta_i \frac{z_1 f' - f}{z_1 f'} \left(1 + \frac{1}{z_1} \sum_{l=2}^n (1 - \gamma_l) P_l(z_l) \right) \right], & i = 1, \dots, s, \\ h_{s+1} = \frac{f}{f'} + \frac{f}{z_1 f'} \sum_{l=2}^n (1 - \gamma_l) P_l(z_l), \\ h_{s+j} = z_j \left[1 - \frac{1}{\gamma_j} \frac{z_1 f' - f}{z_1 f'} \left(1 + \frac{1}{z_1} \sum_{l=2}^n (1 - \gamma_l) P_l(z_l) \right) \right], & j = 2, \dots, n. \end{cases}$$

于是由引理 2.4 知结论成立. 证毕.

引理 2.6 [15] 设 Ω 是 \mathbb{C}^n 中的有界星形圆型域, 其 Minkowski 泛函 $\rho(z)$ 在除去一个低微流形外是 C^1 的, 则

$$2 \frac{\partial \rho(z)}{\partial z} z = \rho(z), \quad \frac{\partial \rho}{\partial z}(\lambda z) = \frac{\partial \rho(z)}{\partial z} \quad (\lambda \geq 0), \quad \frac{\partial \rho}{\partial z}(e^{i\theta} z) = e^{-i\theta} \frac{\partial \rho(z)}{\partial z} \quad (\theta \in R).$$

以下令 Ω 表示 $\Omega_{p_1, \dots, p_s, q}^{B^n}$.

3 强 α 次殆 β 型螺形映照的不变性

定理 3.1 设 $f(z_1)$ 是强 α 次殆 β 型螺形函数且 $\alpha \in [0, 1]$, $\beta \in (-\frac{\pi}{2}, \frac{\pi}{2})$, $c \in (0, \frac{1}{3}]$. 令 $F(w, z)$ 是由式 (1.2) 所定义的映照且 $p_i > 1$, $\delta_i \in [0, 1]$ ($i = 1, \dots, s$), $\gamma_j \geq 2$ ($j = 2, \dots, n$), $(\frac{f(z_1)}{z_1})^{\delta_i}|_{z_1=0} = 1$, $(\frac{f(z_1)}{z_1})^{\frac{1}{\gamma_j}}|_{z_1=0} = 1$. 若

$$q \geq \frac{\delta}{n+1}, \quad \|P_j\| \leq \frac{2c(1-\alpha)\cos\beta}{\gamma_j(1+c)[(1-\alpha)\cos\beta+1]},$$

则 $F(w, z)$ 是 Ω 上的强 α 次殆 β 型螺形映照, 其中 $\delta = \max\{p_1\delta_1, \dots, p_s\delta_s\}$.

证明 由定义 2.1 需证

$$\left| \frac{1-c^2}{2c} \frac{1-i\tan\beta}{1-\alpha} \frac{2}{\rho(w, z)} \frac{\partial \rho(w, z)}{\partial(w, z)} (DF(w, z))^{-1} F(w, z) + \frac{1-c^2-\alpha+i\tan\beta}{2c} - \frac{1+c^2}{2c} \right| < 1. \quad (3.1)$$

显然, $w = z_0 = 0$ 时, 式 (3.1) 成立. 否则, 令 $(w, z) = \zeta(\xi, \eta) = |\zeta|e^{i\theta}(\xi, \eta)$, 其中 $(\xi, \eta) \in \partial\Omega$, $\zeta \in \bar{D} \setminus \{0\}$, 由引理 2.6 得

$$\begin{aligned} & \frac{2}{\rho(w, z)} \frac{\partial \rho(w, z)}{\partial(w, z)} (DF(w, z))^{-1} F(w, z) \\ &= \frac{2}{\rho(|\zeta|e^{i\theta}(\xi, \eta))} \frac{\partial \rho}{\partial(w, z)} (|\zeta|e^{i\theta}(\xi, \eta))(DF(\zeta\xi, \zeta\eta))^{-1} F(\zeta\xi, \zeta\eta) \\ &= \frac{2}{|\zeta|} \frac{e^{-i\theta} \partial \rho}{\partial(w, z)}(\xi, \eta)(DF(\zeta\xi, \zeta\eta))^{-1} F(\zeta\xi, \zeta\eta) \\ &= \frac{2\partial\rho}{\partial(w, z)}(\xi, \eta) \frac{(DF(\zeta\xi, \zeta\eta))^{-1} F(\zeta\xi, \zeta\eta)}{\zeta}. \end{aligned}$$

固定 ξ 和 η , $\frac{2\partial\rho}{\partial(w, z)}(\xi, \eta) \frac{(DF(\zeta\xi, \zeta\eta))^{-1} F(\zeta\xi, \zeta\eta)}{\zeta}$ 关于 ζ 是全纯的. 由全纯函数的最大模原理, (3.1) 的左端在 $|\zeta| = 1$ 时得到最大值. 于是, 我们只需证式 (3.1) 在 $(w, z) \in \partial\Omega$ 时成立即可, 此时 $\rho(w, z) = 1$. 以下令

$$h(z_1) = \frac{1-c^2}{2c} \frac{1-i\tan\beta}{1-\alpha} \frac{f(z_1)}{z_1 f'(z_1)} + \frac{1-c^2-\alpha+i\tan\beta}{2c} - \frac{1+c^2}{2c}, \quad (3.2)$$

则 $h(z_1) \in H(D)$, $|h(z_1)| < 1$ 且 $h(0) = -c$. 令

$$g(z_1) = \frac{2c}{1-c^2}(h(z_1) + c),$$

则 $g(z_1) \in H(D)$, $g(0) = 0$. 又 $|h(z_1)| = |\frac{1-c^2}{2c}g(z_1) - c| < 1$, 且 $\frac{1-c^2}{2c}|g(z_1)| - c < |\frac{1-c^2}{2c}g(z_1) - c|$, 则 $c \leq \frac{1}{3}$ 时, 有 $|g(z_1)| < \frac{2c}{1-c} < 1$. 由 Schwarz 引理得 $|g(z_1)| \leq |z_1|$, 故

$$|h(z_1) + c| \leq \frac{1-c^2}{2c}|z_1|. \quad (3.3)$$

令

$$\frac{1-c^2}{2c} \frac{1-i\tan\beta}{1-\alpha} \frac{2\partial\rho(w,z)}{\partial(w,z)} (DF(w,z))^{-1} F(w,z) + \frac{1-c^2}{2c} \frac{-\alpha+i\tan\beta}{1-\alpha} - \frac{1+c^2}{2c} = I.$$

由引理 2.5 和 (3.2), 得

$$\begin{aligned} (\nabla_1 + \nabla_2)I &= \frac{1-c^2}{2c} \frac{1-i\tan\beta}{1-\alpha} G(w,z) + \left(\frac{1-c^2}{2c} \frac{-\alpha+i\tan\beta}{1-\alpha} - \frac{1+c^2}{2c} \right) (\nabla_1 + \nabla_2) \\ &= \sum_{k=1}^s p_k \|w_{(k)}\|^{2p_k} \left[\frac{1-c^2}{2c} \frac{1-i\tan\beta}{1-\alpha} + \delta_k(h(z_1) + c) \left(1 + \frac{1}{z_1} \sum_{l=2}^n (1-\gamma_l) P_l(z_l) \right) \right] \\ &\quad + \frac{|z_1|^2 \nabla_1}{\|z\|^2} \left[h(z_1) - \frac{1-c^2}{2c} \frac{-\alpha+i\tan\beta}{1-\alpha} + \frac{1+c^2}{2c} \right] \left[1 + \frac{1}{z_1} \sum_{l=2}^n (1-\gamma_l) P_l(z_l) \right] \\ &\quad + \sum_{j=2}^n \frac{|z_j|^2 \nabla_1}{\|z\|^2} \left[\frac{1-c^2}{2c} \frac{1-i\tan\beta}{1-\alpha} + \frac{1}{\gamma_j} (h(z_1) + c) \left(1 + \frac{1}{z_1} \sum_{l=2}^n (1-\gamma_l) P_l(z_l) \right) \right] \\ &\quad + \left(\frac{1-c^2}{2c} \frac{-\alpha+i\tan\beta}{1-\alpha} - \frac{1+c^2}{2c} \right) (\nabla_1 + \nabla_2) \\ &= c \frac{\nabla_1}{\|z\|^2} \sum_{j=2}^n \left(\frac{1}{\gamma_j} - 1 \right) |z_j|^2 + c(\widetilde{\nabla}_2 - \nabla_2) + \left[\widetilde{\nabla}_2 + \frac{\nabla_1}{\|z\|^2} \left(|z_1|^2 + \sum_{j=2}^n \frac{|z_j|^2}{\gamma_j} \right) \right] h(z_1) \\ &\quad + \left[\widetilde{\nabla}_2(h(z_1) + c) + \frac{\nabla_1|z_1|^2}{\|z\|^2} \left(h(z_1) - \frac{1-c^2}{2c} \frac{-\alpha+i\tan\beta}{1-\alpha} + \frac{1+c^2}{2c} \right) \right. \\ &\quad \left. + \frac{\nabla_1}{\|z\|^2} \sum_{j=2}^n \frac{|z_j|^2}{\gamma_j} (h(z_1) + c) \right] \frac{1}{z_1} \sum_{l=2}^n (1-\gamma_l) P_l(z_l) \\ &= c \frac{\nabla_1}{\|z\|^2} \sum_{j=2}^n \left(\frac{1}{\gamma_j} - 1 \right) |z_j|^2 + c(\widetilde{\nabla}_2 - \nabla_2) + \left[\widetilde{\nabla}_2 + \frac{\nabla_1}{\|z\|^2} \left(|z_1|^2 + \sum_{j=2}^n \frac{|z_j|^2}{\gamma_j} \right) \right] h(z_1) \\ &\quad + \left[\widetilde{\nabla}_2 + \frac{\nabla_1}{\|z\|^2} \left(|z_1|^2 + \sum_{j=2}^n \frac{|z_j|^2}{\gamma_j} \right) \right] (h(z_1) + c) \frac{1}{z_1} \sum_{l=2}^n (1-\gamma_l) P_l(z_l) \\ &\quad + \frac{1-c^2}{2c} \frac{1-i\tan\beta}{1-\alpha} \frac{|z_1|^2 \nabla_1}{\|z\|^2} \frac{1}{z_1} \sum_{l=2}^n (1-\gamma_l) P_l(z_l), \end{aligned}$$

其中 $\widetilde{\nabla}_2 = \sum_{k=1}^s \delta_k p_k \|w_k\|^{2p_k}$. 应用 (3.3) 和 $|h(z_1)| < 1$, 得

$$\begin{aligned} (\nabla_1 + \nabla_2)(|I| - 1) &< c \frac{\nabla_1}{\|z\|^2} \sum_{j=2}^n \left(1 - \frac{1}{\gamma_j} \right) |z_j|^2 + c(\nabla_2 - \widetilde{\nabla}_2) + \widetilde{\nabla}_2 + \frac{\nabla_1}{\|z\|^2} \left(|z_1|^2 + \sum_{j=2}^n \frac{|z_j|^2}{\gamma_j} \right) \\ &\quad - \nabla_1 - \nabla_2 + \left[\widetilde{\nabla}_2 + \frac{\nabla_1}{\|z\|^2} \left(|z_1|^2 + \sum_{j=2}^n \frac{|z_j|^2}{\gamma_j} \right) \right] \frac{1-c^2}{2c} \sum_{l=2}^n (\gamma_l - 1) |P_l(z_l)| \\ &\quad + \frac{1-c^2}{2c} \frac{1}{(1-\alpha)\cos\beta} \frac{|z_1|\nabla_1}{\|z\|^2} \sum_{l=2}^n (\gamma_l - 1) |P_l(z_l)| \end{aligned}$$

$$\begin{aligned} &\leq (c-1) \frac{\nabla_1}{\|z\|^2} \sum_{j=2}^n \left(1 - \frac{1}{\gamma_j}\right) |z_j|^2 + (c-1)(\nabla_2 - \widetilde{\nabla}_2) \\ &+ \frac{1-c^2}{2c} \frac{\nabla_1}{\|z\|^2} \sum_{l=2}^n (\gamma_l - 1) |P_l(z_l)| \left[\frac{\widetilde{\nabla}_2}{\nabla_1} \|z\|^2 + |z_1|^2 + \sum_{j=2}^n \frac{|z_j|^2}{\gamma_j} + \frac{1}{(1-\alpha) \cos \beta} \right]. \end{aligned}$$

另外, 由 $(w, z) \in \Omega_{p_1, \dots, p_s, q}^{B^n}$, 得

$$\sum_{k=1}^s \|w_{(k)}\|^{2p_k} < K_{B^n}(z, z)^{-q} = \left(\frac{\pi^n}{n!}\right)^q (1 - \|z\|^2)^{(n+1)q}.$$

由于 $\nabla_1 = (n+1)q\pi^{nq}(n!)^{-q}(1 - \|z\|^2)^{(n+1)q-1}\|z\|^2$, $\widetilde{\nabla}_2 < \delta \sum_{k=1}^s \|w_k\|^{2p_k}$, 则

$$\frac{\widetilde{\nabla}_2}{\nabla_1} < \frac{\delta(1 - \|z\|^2)}{(n+1)q\|z\|^2}.$$

于是, 当 $q \geq \frac{\delta}{n+1}$ 时, 有

$$\begin{aligned} \frac{\widetilde{\nabla}_2}{\nabla_1} \|z\|^2 + |z_1|^2 + \sum_{j=2}^n \frac{|z_j|^2}{\gamma_j} &< \frac{\delta}{(n+1)q}(1 - \|z\|^2) + \|z\|^2 + \sum_{j=2}^n \left(\frac{1}{\gamma_j} - 1\right) |z_j|^2 \\ &= \frac{\delta}{(n+1)q} + \left(1 - \frac{\delta}{(n+1)q}\right) \|z\|^2 + \sum_{j=2}^n \left(\frac{1}{\gamma_j} - 1\right) |z_j|^2 < 1. \quad (3.4) \end{aligned}$$

故

$$\begin{aligned} (\nabla_1 + \nabla_2)(|I|-1) &< (c-1) \frac{\nabla_1}{\|z\|^2} \sum_{j=2}^n \left(1 - \frac{1}{\gamma_j}\right) |z_j|^2 + \frac{1-c^2}{2c} \frac{\nabla_1}{\|z\|^2} \sum_{l=2}^n (\gamma_l - 1) |P_l(z_l)| \left[1 + \frac{1}{(1-\alpha) \cos \beta}\right] \\ &\leq (c-1) \frac{\nabla_1}{\|z\|^2} \sum_{j=2}^n \left(1 - \frac{1}{\gamma_j}\right) |z_j|^2 + \frac{1-c^2}{2c} \frac{\nabla_1}{\|z\|^2} \sum_{l=2}^n (\gamma_l - 1) \|P_l\| |z_l|^2 \frac{(1-\alpha) \cos \beta + 1}{(1-\alpha) \cos \beta} \\ &= \frac{1-c^2}{2c} \frac{(1-\alpha) \cos \beta + 1}{(1-\alpha) \cos \beta} \frac{\nabla_1}{\|z\|^2} \sum_{j=2}^n (\gamma_j - 1) |z_j|^2 \left[\|P_j\| - \frac{2c(1-\alpha) \cos \beta}{(1+c)[(1-\alpha) \cos \beta + 1]} \frac{1}{\gamma_j}\right] \\ &< 0, \end{aligned}$$

其中

$$\gamma_j \geq 2, \quad \|P_j\| \leq \frac{2c(1-\alpha) \cos \beta}{\gamma_j(1+c)[(1-\alpha) \cos \beta + 1]}.$$

于是 (3.1) 成立, 则定理得证.

由定理 3.1 可得以下结论:

推论 3.2 设 $f(z_1)$ 是强 α 次殆 β 型螺形函数且 $\alpha \in [0, 1)$, $\beta \in (-\frac{\pi}{2}, \frac{\pi}{2})$, $c \in (0, \frac{1}{3}]$. 令 $F(z)$ 是由 (1.3) 所定义的映照且 $\gamma_j \geq 2$ ($j = 2, \dots, n$), $(\frac{f(z_1)}{z_1})^{\frac{1}{\gamma_j}}|_{z_1=0} = 1$. 若

$$\|P_j\| \leq \frac{2c(1-\alpha) \cos \beta}{\gamma_j(1+c)[(1-\alpha) \cos \beta + 1]},$$

则 $F(z)$ 是 B^n 上的强 α 次殆 β 型螺形映照.

注 3.3 在定理 3.1 和推论 3.2 中分别令 $\alpha = 0$ 及 $\beta = 0$, 则得到相应的关于强 α 次殆星形映照和强 β 型螺形映照的结论.

4 复数 λ 阶殆星形映照的不变性

定理 4.1 设 $f(z_1)$ 是 D 上的复数 λ 阶殆星形函数且 $\lambda \in \mathbb{C}$, $\Re \lambda \leq 0$. 令 $F(w, z)$ 是由(1.2) 所定义的函数且 $p_i > 1$, $\delta_i \in [0, 1]$ ($i = 1, \dots, s$), $\gamma_j \geq 4$ ($j = 2, \dots, n$), $(\frac{f(z_1)}{z_1})^{\delta_i}|_{z_1=0} = 1$, $(\frac{f(z_1)}{z_1})^{\frac{1}{\gamma_j}}|_{z_1=0} = 1$. 若

$$q \geq \frac{\delta}{n+1}, \quad \|P_j\| \leq \frac{1}{2\gamma_j(2 + |1 - \lambda|)},$$

则 $F(w, z)$ 是 Ω 上的复数 λ 阶殆星形映照, 其中 $\delta = \max\{p_1\delta_1, \dots, p_s\delta_s\}$.

证明 由定义 2.2, 只需证

$$\Re \left[(1 - \lambda) \frac{2}{\rho(w, z)} \frac{\partial \rho}{\partial(w, z)}(w, z) (DF(w, z))^{-1} F(w, z) \right] + \Re \lambda \geq 0. \quad (4.1)$$

当 $w = z_0 = 0$ 时, 式 (4.1) 显然成立. 类似于定理 3.1 知

$$\Re \left[(1 - \lambda) \frac{2}{\rho(w, z)} \frac{\partial \rho}{\partial(w, z)}(w, z) (DF(w, z))^{-1} F(w, z) + \lambda \right]$$

是一个全纯函数的实部从而调和. 由调和函数的最小值原理只需证在 $z \in \partial\Omega$ 时, 式 (4.1) 成立即可, 此时 $\rho(w, z) = 1$.

由于 $f(z_1)$ 是 D 上的复数 λ 阶殆星形函数, 由定义 2.2 有

$$\Re \left[(1 - \lambda) \frac{f(z_1)}{z_1 f'(z_1)} + \lambda \right] \geq 0.$$

令

$$h(z_1) = (1 - \lambda) \frac{f(z_1)}{z_1 f'(z_1)} + \lambda, \quad (4.2)$$

则 $\Re h(z_1) > 0$, $h(0) = 1$. 令

$$g(z_1) = \frac{h(z_1) - 1}{h(z_1) + 1},$$

则 $g(z_1) \in H(D)$, $|g(z_1)| < 1$ 且 $g(0) = 0$. 由 Schwarz 引理得 $|g(z_1)| \leq |z_1|$, 即

$$\left| 1 + \frac{2}{h(z_1) - 1} \right| \geq \frac{1}{|z_1|}.$$

于是

$$|h(z_1) - 1| \leq \frac{2|z_1|}{1 - |z_1|}. \quad (4.3)$$

由引理 2.5 和 (4.2) 得

$$\begin{aligned} & (\nabla_1 + \nabla_2) \left[(1 - \lambda) \frac{2\partial\rho}{\partial(w, z)}(w, z) (DF(w, z))^{-1} F(w, z) + \lambda \right] \\ &= (1 - \lambda) \left\{ \sum_{k=1}^s p_k \|w_{(k)}\|^{2p_k} \left[1 - \delta_k \frac{z_1 f' - f}{z_1 f'} \left(1 + \frac{1}{z_1} \sum_{l=2}^n (1 - \gamma_l) P_l(z_l) \right) \right] \right. \\ & \quad + \frac{|z_1|^2 \nabla_1}{\|z\|^2} \frac{f}{z_1 f'} \left[1 + \frac{1}{z_1} \sum_{l=2}^n (1 - \gamma_l) P_l(z_l) \right] \\ & \quad \left. + \sum_{j=2}^n \frac{|z_j|^2 \nabla_1}{\|z\|^2} \left[1 - \frac{1}{\gamma_j} \frac{z_1 f' - f}{z_1 f'} \left(1 + \frac{1}{z_1} + \sum_{l=2}^n (1 - \gamma_l) P_l(z_l) \right) \right] \right\} + \lambda(\nabla_1 + \nabla_2) \end{aligned}$$

$$\begin{aligned}
&= (1 - \lambda) \nabla_2 - \widetilde{\nabla}_2 (1 - h(z_1)) \left[1 + \frac{1}{z_1} \sum_{l=2}^n (1 - \gamma_l) P_l(z_l) \right] \\
&\quad + \frac{|z_1|^2 \nabla_1}{\|z\|^2} (h(z_1) - \lambda) \left[1 + \frac{1}{z_1} \sum_{l=2}^n (1 - \gamma_l) P_l(z_l) \right] \\
&\quad + \sum_{j=2}^n \frac{|z_j|^2 \nabla_1}{\|z\|^2} \left[1 - \lambda - \frac{1}{\gamma_j} (1 - h(z_1)) \left(1 + \frac{1}{z_1} \sum_{l=2}^n (1 - \gamma_l) P_l(z_l) \right) \right] + \lambda (\nabla_1 + \nabla_2) \\
&= \frac{\nabla_1}{\|z\|^2} \sum_{j=2}^n \left(1 - \frac{1}{\gamma_j} \right) |z_j|^2 + \nabla_2 - \widetilde{\nabla}_2 + \left[\widetilde{\nabla}_2 + \frac{\nabla_1}{\|z\|^2} \left(|z_1|^2 + \sum_{j=2}^n \frac{|z_j|^2}{\gamma_j} \right) \right] h(z_1) \\
&\quad + \left[\widetilde{\nabla}_2 (h(z_1) - 1) + \frac{\nabla_1 |z_1|^2}{\|z\|^2} (h(z_1) - \lambda) + \frac{\nabla_1}{\|z\|^2} \sum_{j=2}^n \frac{|z_j|^2}{\gamma_j} (h(z_1) - 1) \right] \frac{1}{z_1} \sum_{l=2}^n (1 - \gamma_l) P_l(z_l) \\
&= \frac{\nabla_1}{\|z\|^2} \sum_{j=2}^n \left(1 - \frac{1}{\gamma_j} \right) |z_j|^2 + \nabla_2 - \widetilde{\nabla}_2 + \left[\widetilde{\nabla}_2 + \frac{\nabla_1}{\|z\|^2} \left(|z_1|^2 + \sum_{j=2}^n \frac{|z_j|^2}{\gamma_j} \right) \right] h(z_1) \\
&\quad + \left[\widetilde{\nabla}_2 + \frac{\nabla_1}{\|z\|^2} \left(|z_1|^2 + \sum_{j=2}^n \frac{|z_j|^2}{\gamma_j} \right) \right] (h(z_1) - 1) \frac{1}{z_1} \sum_{l=2}^n (1 - \gamma_l) P_l(z_l) \\
&\quad + (1 - \lambda) \frac{\nabla_1 |z_1|^2}{\|z\|^2} \frac{1}{z_1} \sum_{l=2}^n (1 - \gamma_l) P_l(z_l).
\end{aligned}$$

由 (4.3), (3.4) 及 $\Re h(z_1) > 0$, 得

$$\begin{aligned}
&(\nabla_1 + \nabla_2) \Re \left[(1 - \lambda) \frac{2\partial\rho}{\partial(w, z)} (w, z) (DF(w, z))^{-1} F(w, z) + \lambda \right] \\
&\geq \frac{\nabla_1}{\|z\|^2} \sum_{j=2}^n \left(1 - \frac{1}{\gamma_j} \right) |z_j|^2 + \nabla_2 - \widetilde{\nabla}_2 - \left[\widetilde{\nabla}_2 + \frac{\nabla_1}{\|z\|^2} \left(|z_1|^2 + \sum_{j=2}^n \frac{|z_j|^2}{\gamma_j} \right) \right] \\
&\quad \cdot \frac{2}{1 - |z_1|} \sum_{l=2}^n (\gamma_l - 1) |P_l(z_l)| - |1 - \lambda| \frac{\nabla_1 |z_1|}{\|z\|^2} \sum_{l=2}^n (\gamma_l - 1) |P_l(z_l)| \\
&\geq \frac{\nabla_1}{\|z\|^2} \sum_{j=2}^n \left(1 - \frac{1}{\gamma_j} \right) |z_j|^2 \\
&\quad - \frac{\nabla_1}{\|z\|^2} \sum_{l=2}^n (\gamma_l - 1) |P_l(z_l)| \left[\frac{2}{1 - |z_1|} \left(\frac{\widetilde{\nabla}_2}{\nabla_1} \|z\|^2 + |z_1|^2 + \sum_{j=2}^n \frac{|z_j|^2}{\gamma_j} \right) + |1 - \lambda| \right] \\
&\geq \frac{\nabla_1}{\|z\|^2} \sum_{j=2}^n \left(1 - \frac{1}{\gamma_j} \right) |z_j|^2 - \frac{\nabla_1}{\|z\|^2} \sum_{l=2}^n (\gamma_l - 1) \|P_l\| |z_l|^{\gamma_l} (2 + |1 - \lambda|) \frac{1}{1 - |z_1|} \\
&= (2 + |1 - \lambda|) \frac{\nabla_1}{\|z\|^2} \sum_{l=2}^n (\gamma_l - 1) |z_l|^2 \left[\frac{1}{(2 + |1 - \lambda|) \gamma_l} - \|P_l\| \frac{|z_l|^2}{1 - |z_1|} |z_l|^{\gamma_l - 4} \right] \\
&\geq (2 + |1 - \lambda|) \frac{\nabla_1}{\|z\|^2} \sum_{j=2}^n (\gamma_j - 1) |z_j|^2 \left[\frac{1}{(2 + |1 - \lambda|) \gamma_j} - 2 \|P_j\| \right] \geq 0,
\end{aligned}$$

其中

$$\gamma_j \geq 4, \quad \|P_j\| \leq \frac{1}{2\gamma_j(2 + |1 - \lambda|)},$$

则式 (4.1) 成立, 于是定理得证.

由定理 4.1 可得以下结论:

推论 4.2 设 $f(z_1)$ 是 D 上的复数 λ 阶殆星形函数且 $\lambda \in \mathbb{C}$, $\Re \lambda \leq 0$. 令 $F(z)$ 是由式 (1.3) 所定义的映照且 $\gamma_j \geq 4$ ($j = 2, \dots, n$), $(\frac{f(z_1)}{z_1})^{\frac{1}{\gamma_j}}|_{z_1=0} = 1$. 若

$$\|P_j\| \leq \frac{1}{2\gamma_j(2 + |1 - \lambda|)},$$

则 $F(z)$ 是 B^n 上的复数 λ 阶殆星形映照.

注 4.3 在定理 4.1 和推论 4.2 中令

$$\lambda = \frac{\alpha}{\alpha - 1}, \quad \alpha \in [0, 1),$$

则得到相应的关于 α 次殆星形映照的结论.

5 $S_\Omega^*(\beta, A, B)$ 的不变性

定理 5.1 设 $f(z_1) \in S_D^*(\beta, A, B)$ 且 $-1 \leq A < B < \frac{A+1}{2} < 1$, $\beta \in (-\frac{\pi}{2}, \frac{\pi}{2})$. 令 $F(w, z)$ 是由式 (1.2) 所定义的映照且 $p_i > 1$, $\delta_i \in [0, 1]$ ($i = 1, \dots, s$), $\gamma_j \geq 2$ ($j = 2, \dots, n$), $(\frac{f(z_1)}{z_1})^{\delta_i}|_{z_1=0} = 1$, $(\frac{f(z_1)}{z_1})^{\frac{1}{\gamma_j}}|_{z_1=0} = 1$. 若

$$q \geq \frac{\delta}{n+1}, \quad \|P_j\| \leq \frac{(B-A)\cos\beta}{\gamma_j(1+B)(1+\cos\beta)},$$

则 $F(w, z) \in S_\Omega^*(\beta, A, B)$, 其中 $\delta = \max\{p_1\delta_1, \dots, p_s\delta_s\}$.

证明 由定义 2.3 需证

$$\left| \frac{1-B^2}{B-A} \left[i \tan \beta + (1-i \tan \beta) \frac{2}{\rho(w,z)} \frac{\partial \rho(w,z)}{\partial(w,z)} (DF(w,z))^{-1} F(w,z) \right] - \frac{1-AB}{B-A} \right| < 1. \quad (5.1)$$

类似于定理 3.1, 只需证当 $(w, z) \in \partial\Omega$ 时, 式 (5.1) 成立即可, 此时 $\rho(w, z) = 1$.

由于 $f(z_1) \in S_D^*(\beta, A, B)$, 由定义 2.3 得

$$\left| i \tan \beta + (1-i \tan \beta) \frac{f(z_1)}{z_1 f'(z_1)} - \frac{1-AB}{1-B^2} \right| < \frac{B-A}{1-B^2}.$$

令

$$\frac{1-B^2}{B-A} i \tan \beta + \frac{1-B^2}{B-A} (1-i \tan \beta) \frac{f(z_1)}{z_1 f'(z_1)} - \frac{1-AB}{B-A} = h(z_1), \quad (5.2)$$

则 $|h(z_1)| < 1$, $h(0) = -B$. 令

$$g(z_1) = \frac{B-A}{1-B^2} (h(z_1) + B),$$

则 $g(z_1) \in H(D)$, $g(0) = 0$ 且

$$|h(z_1)| = \left| \frac{1-B^2}{B-A} g(z_1) - B \right| < 1.$$

由于

$$\frac{1-B^2}{B-A} |g(z_1)| - |B| \leq \left| \frac{1-B^2}{B-A} g(z_1) - B \right|,$$

于是

$$|g(z_1)| < \frac{(1+|B|)(B-A)}{1-B^2} \leq 1,$$

其中 $-1 \leq A < B < \frac{A+1}{2} < 1$. 由 Schwarz 引理得 $|g(z_1)| \leq |z_1|$, 于是

$$|h(z_1) + B| \leq \frac{1 - B^2}{B - A} |z_1|. \quad (5.3)$$

令

$$\frac{1 - B^2}{B - A} i \tan \beta + \frac{1 - B^2}{B - A} (1 - i \tan \beta) \frac{2\partial\rho(w, z)}{\partial(w, z)} (DF(w, z))^{-1} F(w, z) - \frac{1 - AB}{B - A} = I.$$

由引理 2.5 和 (5.2), 得

$$\begin{aligned} (\nabla_1 + \nabla_2)I &= \frac{1 - B^2}{B - A} (1 - i \tan \beta) G(w, z) + \left(\frac{1 - B^2}{B - A} i \tan \beta - \frac{1 - AB}{B - A} \right) (\nabla_1 + \nabla_2) \\ &= \frac{1 - B^2}{B - A} (1 - i \tan \beta) \nabla_2 + \widetilde{\nabla}_2 [h(z_1) + B] \left[1 + \frac{1}{z_1} \sum_{l=2}^n (1 - \gamma_l) P_l(z_l) \right] \\ &\quad + \frac{|z_1|^2 \nabla_1}{\|z\|^2} \left[h(z_1) - \frac{1 - B^2}{B - A} i \tan \beta + \frac{1 - AB}{B - A} \right] \left[1 + \frac{1}{z_1} \sum_{l=2}^n (1 - \gamma_l) P_l(z_l) \right] \\ &\quad + \sum_{j=2}^n \frac{|z_j|^2 \nabla_1}{\|z\|^2} \left[\frac{1 - B^2}{B - A} (1 - i \tan \beta) + \frac{1}{\gamma_j} (h(z_1) + B) \left(1 + \frac{1}{z_1} \sum_{l=2}^n (1 - \gamma_l) P_l(z_l) \right) \right] \\ &\quad + \left(\frac{1 - B^2}{B - A} i \tan \beta - \frac{1 - AB}{B - A} \right) (\nabla_1 + \nabla_2) \\ &= \frac{B \nabla_1}{\|z\|^2} \sum_{j=2}^n \left(\frac{1}{\gamma_j} - 1 \right) |z_j|^2 + B(\widetilde{\nabla}_2 - \nabla_2) + \left[\widetilde{\nabla}_2 + \frac{\nabla_1}{\|z\|^2} \left(|z_1|^2 + \sum_{j=2}^n \frac{|z_j|^2}{\gamma_j} \right) \right] h(z_1) \\ &\quad + \left[\widetilde{\nabla}_2 (h(z_1) + B) + \frac{|z_1|^2 \nabla_1}{\|z\|^2} \left(h(z_1) - \frac{1 - B^2}{B - A} i \tan \beta + \frac{1 - AB}{B - A} \right) \right. \\ &\quad \left. + \frac{\nabla_1}{\|z\|^2} \sum_{j=2}^n \frac{|z_j|^2}{\gamma_j} (h(z_1) + B) \right] \frac{1}{z_1} \sum_{l=2}^n (1 - \gamma_l) P_l(z_l) \\ &= \frac{B \nabla_1}{\|z\|^2} \sum_{j=2}^n \left(\frac{1}{\gamma_j} - 1 \right) |z_j|^2 + B(\widetilde{\nabla}_2 - \nabla_2) + \left[\widetilde{\nabla}_2 + \frac{\nabla_1}{\|z\|^2} \left(|z_1|^2 + \sum_{j=2}^n \frac{|z_j|^2}{\gamma_j} \right) \right] h(z_1) \\ &\quad + \left[\widetilde{\nabla}_2 + \frac{\nabla_1}{\|z\|^2} \left(|z_1|^2 + \sum_{j=2}^n \frac{|z_j|^2}{\gamma_j} \right) (h(z_1) + B) \right] \frac{1}{z_1} \sum_{l=2}^n (1 - \gamma_l) P_l(z_l) \\ &\quad + \frac{1 - B^2}{B - A} (1 - i \tan \beta) \frac{|z_1|^2 \nabla_1}{\|z\|^2} \frac{1}{z_1} \sum_{l=2}^n (1 - \gamma_l) P_l(z_l). \end{aligned}$$

由 (5.3), (3.4) 及 $|h(z_1)| < 1$, 得

$$\begin{aligned} (\nabla_1 + \nabla_2)(|I| - 1) &< \frac{B \nabla_1}{\|z\|^2} \sum_{j=2}^n \left(1 - \frac{1}{\gamma_j} \right) |z_j|^2 + B(\nabla_2 - \widetilde{\nabla}_2) \\ &\quad + \left[\widetilde{\nabla}_2 + \frac{\nabla_1}{\|z\|^2} \left(|z_1|^2 + \sum_{j=2}^n \frac{|z_j|^2}{\gamma_j} \right) \right] - (\nabla_1 + \nabla_2) \\ &\quad + \left[\widetilde{\nabla}_2 + \frac{\nabla_1}{\|z\|^2} \left(|z_1|^2 + \sum_{j=2}^n \frac{|z_j|^2}{\gamma_j} \right) \right] \frac{1 - B^2}{B - A} \sum_{l=2}^n (\gamma_l - 1) |P_l(z_l)| \\ &\quad + \frac{1 - B^2}{(B - A) \cos \beta} \frac{|z_1| \nabla_1}{\|z\|^2} \sum_{l=2}^n (\gamma_l - 1) |P_l(z_l)| \end{aligned}$$

$$\begin{aligned}
&\leq (B-1) \frac{\nabla_1}{\|z\|^2} \sum_{j=2}^n \left(1 - \frac{1}{\gamma_j}\right) |z_j|^2 + (B-1)(\nabla_2 - \widetilde{\nabla}_2) \\
&\quad + \frac{1-B^2}{B-A} \frac{\nabla_1}{\|z\|^2} \sum_{l=2}^n (\gamma_l - 1) |P_l(z_l)| \left[\frac{\widetilde{\nabla}_2}{\nabla_1} \|z\|^2 + |z_1|^2 + \sum_{j=2}^n \frac{|z_j|^2}{\gamma_j} + \frac{1}{\cos \beta} \right] \\
&< (B-1) \frac{\nabla_1}{\|z\|^2} \sum_{j=2}^n \left(1 - \frac{1}{\gamma_j}\right) |z_j|^2 \\
&\quad + \frac{1-B^2}{B-A} \frac{1+\cos\beta}{\cos\beta} \frac{\nabla_1}{\|z\|^2} \sum_{l=2}^n (\gamma_l - 1) \|P_l\| |z_l|^2 \\
&= \frac{1-B^2}{B-A} \frac{1+\cos\beta}{\cos\beta} \frac{\nabla_1}{\|z\|^2} \sum_{j=2}^n (\gamma_j - 1) |z_j|^2 \left[\|P_j\| - \frac{(B-A)\cos\beta}{\gamma_j(1+B)(1+\cos\beta)} \right] \\
&\leq 0,
\end{aligned}$$

其中

$$\|P_j\| \leq \frac{(B-A)\cos\beta}{\gamma_j(1+B)(1+\cos\beta)}.$$

从而式 (5.1) 成立, 故 $F(w, z) \in S_\Omega^*(\beta, A, B)$. 证毕.

由定理 5.1 可得以下结论:

推论 5.2 设 $f(z_1) \in S_D^*(\beta, A, B)$ 且 $-1 \leq A < B < \frac{A+1}{2} < 1$, $\beta \in (-\frac{\pi}{2}, \frac{\pi}{2})$. 令 $F(z)$ 是由式 (1.3) 所定义的映照且 $\gamma_j \geq 2$ ($j = 2, \dots, n$), $(\frac{f(z_1)}{z_1})^{\frac{1}{\gamma_j}}|_{z_1=0} = 1$. 若

$$\|P_j\| \leq \frac{(B-A)\cos\beta}{\gamma_j(1+B)(1+\cos\beta)},$$

则 $F(z) \in S_{B^n}^*(\beta, A, B)$.

注 5.3 在定理 5.1 和推论 5.2 中分别令 $A = -1 = -B - 2\alpha$ 及 $A = -B = -\alpha$, 则得到相应的关于 α 次 β 型螺形映照及 α 次 β 型螺形映照的结论.

致谢 感谢审稿人提出的宝贵建议.
